

EXPERIMENT

We organised an experiment of the disintegration of paper during the period of one year at our school.

Research question:

Which type of paper disintegrates the quickest in one year?

The students buried the following different types of sheets of paper next to the school house:

- stone paper
- newspaper
- glossy magazine paper
- copy paper

Hypothesis:

Our students made a guess that the newspaper will disintegrate the quickest, followed by the glossy magazine paper and the copy paper. They believe that the stone paper does not disintegrate at all.

After exactly one year we are going to dig up those different types of sheets of paper and find out what is left of them.
